

Chongqing Center adopted Integrated Congress Solution from Bosch

BOSCH
Invented for life

Industry:

Convention and exhibition center

End User:

Chongqing International Convention & Exhibition Center

is located in Nan'an district, Chongqing. It is a comprehensive conference and exhibition center with the largest exhibition and meeting rooms, and the best equipped facilities in West China. Being one of the key infrastructure projects of Chongqing, CICE is positioned to become the best choice for large conferences, exhibitions and other mega events in the region. There are 33 meeting rooms of various sizes in CICE with seating capacity ranging from 100 to 1,500 seats, as well as a multi-function room with capacity of 1,100 people.

Business Objective:

In order to provide highly flexible, professional and comfortable environment to various important occasions such as seminar, training, press conference and theme forum, CICE requires a leading-edge congress solution for its central international conference hall and neighboring meeting facilities. In addition, a highly effective and high quality simultaneous interpretation system is also on the wanted list to meet the request of multi-lingual conferences.

Solution:

Bosch has been chosen to provide the DCN discussion solution to CICE. Based on its central discussion controller managing all delegate microphones, distributing simultaneous interpretation and conducting voting sessions, the elegantly designed DCN solution enables the users to experience the world-class discussions and communications. Furthermore, the easy DCN management through customized software makes the discussion very convenient and efficient for both meeting organizers and delegates.

At CICE, Bosch has further integrated Autodome cameras with the DCN discussion network, which makes the discussion even more attractive and interactive than ever before. Seamlessly integrated into the DCN central controller, the Allegiant Matrix and Autodome cameras system mounted in the meeting room can track the active speaker when he or she activates the dedicate unit. This feature allows the real-time video of the speaker to be displayed simultaneously at the main conference hall and any other remote sites. In addition, the integrated solution offers the meeting organizer a highly efficient process control tool for automatic video and audio recording.

By adopting Bosch Integrus wireless language distribution system, CICE is enabled to facilitate multi-lingual international conferences with its 6 interpreter rooms at the main hall.

Chongqing International Convention & Exhibition Center

Being the world's first fully digital Infra-red language distribution system, Integrus brings superior audio quality and ultimate freedom of movement for delegates. By using a higher frequency band (2 to 8 MHz), the Integrus solution installed at CICE operates way beyond the reach of all types of hall lighting, and offers audience a perfect reception.

Result:

The integrated digital congress solution customized for CICE enhanced the effectiveness and convenience of communications, and ensured the high quality of any conference.

Since it's completion in 2005, CICE has hosted a series of influential conferences and exhibitions such as Asia Pacific Cities Summit 2005, Chongqing Congress Conference and the Feast of the Chongqing Municipality's 10th Anniversary. The venue has now become one of the most important landmark architectures in this metropolis with more than 3,000 years of history.
